Car Park v 1.5 ©GopSoft

Ever finish your shopping, only to think… where did I park my car! Wandering around a parking lot looking for your car is embarrassing! Use Car Park from GopSoft and you'll have the answer in the Palm of your hand…

Car Park is a quick to use Palm OS application that records the location of your car. In addition, you can calculate the elapsed time of your stay to determine if you need to pay extra for your parking. Some locations allow a number of hours free then start charging past that point. Car Park can help you figure out the duration of your stay to the minute, which makes it easy to determine if you must pay extra. If you prevent even one overdue payment, Car Park has paid for itself many times over!

Shareware:

Car Park is Shareware, but very inexpensive (US$3.00). Not much to pay for a program that WILL help you remember where your car is, avoid embarrassment and prevent fines!

Please try the software for 7 days. After that, it will stop working. You can register Car Park at the location you downloaded it from. We will send you a unique registration number. This will remove the nag screen and the 7 day limit on your PDA. Always check the GopSoft website to see if a newer version has been released.

Installation:

Hotsync the installation file **CP15.prc** to your device, then tap its icon. All the necessary files will be installed automatically to your PDA. Refer to your devices documentation if you don't know how to hotsync applications. Car Park uses approximately 180 kb of ram (less if you already have mathlib installed), and should work on any PDA using PalmOS 3.5 or better, though it hasn't been tested on smart phones or tapwaves.

Features:

- Quickly add the start date and time.
- Alarm to warn when your parking limit is near.
- Ability to add multiple parking locations to the drop down quick pick list.
- Record location, level and row (aisle).
- Calculate duration of your parking.
- Record extra information eg. "Parked near the stairs"
- Inexpensive to register! If you save one overdue parking fine/fee, Car Park has paid for itself *many times over!*

Example of Use.

Ideally, decide which car park you will use before arriving. Tap the arrow on the right of **Location** for a dropdown list. Initially this will be empty. Tap the + button to add a location. In the add screen, tap the ? button for help in that area.

When you arrive, tap the line next to **date** (choose today) and then tap the **In time** line. Time defaults to the time set in your PDA. As you exit your car, record the level colour / number, and row you are parked in. If you wish, tap the line next to **Alarm** and set your alarm a bit before you have to return.

When leaving the car park, tap the **out time** line and the time will default to the present time. Tap the little calculator button, and your stay duration will be displayed. You can clear the record by tapping the **NEW** button found at the top of the screen.
